

Nuclear Energy – The Better Energy

Embracing Nuclear energy is the step that will take us closer to a safer and a greener environment. No carbon dioxide emissions, no accumulations of sulfur, least amount of land required and a surprisingly low quantity of waste produced -- all indicating the need for a paradigm change in our attitude towards this better energy. *Nuclear Energy – The Better Energy* is an initiative that has been started to engage with the general public and introduce them to the basic applications of Nuclear Science and how it affects their day-to-day life. The vision behind this initiative is to help the society make an educated and informed decision about the future of nuclear power. Arguments to address the misconceptions that the society has about radiation and Nuclear Energy will be provided in a language that can be understood by a non-specialist population. A comparative analysis of the dose received by the general public from natural and artificial sources of radiation will be done. Lastly, the progress as achieved by the initiative will be highlighted and future course of action will be discussed.
